Configure web server and DNS server.

Configure server as DHCP server

services → HTTP check if both are on.

click on PCo → Desktop → web server → server address

Trying to map Domain name with server.

→ Server → DNS → DNS on → under name given website add
    → under address ip address of server.

purpose of DNS → Map domain name with server address.

Go to PCO web server → give IP address we are
able to config as DNS server as well as web server

→ All domain names have unique IP address.

→ But it is difficult to remember IP address and
hence we have a name which makes it easy
to browse that web page on browser.

→ All domain name is mapped in the back with
unique IP address.
